

Abrasive peeler

*Discover
Kiremko Quality*

The Kiremko abrasive peeler excels in its simplicity, efficiency and minimum footprint. Due to the smart configuration the potatoes are in constant contact with the surface of the drum, with smooth and clean results every time, ideal for potato chips lines and other small scale potato processing lines.

Reliable and robust

The Kiremko abrasive peeler is equipped with a carborundum drum and a bottom plate driven from underneath by a variable speed motor. The peeler has a unique two stage lifting system so that the drum height can be adjusted. This enables different peeling stages to be achieved from rough peeling to a refined polish, so every desired result can be achieved as well as an optimum yield.

Creating simplicity is not an easy task. Our years of experience are what makes it look easy.

Direct and simple

To prevent accumulation of peelings and starch as well as wear of the carborundum lining, it is important to perform regular rinsing. Nozzles are fitted as standard. The peeler is fitted with robust castors to allow it to be easily removed from the process line. The machine is easy to dismantle to enable thorough cleaning and maintenance with a minimum of downtime.

Several abrasive surfaces and variable rotational speed are the keys to the best results.

Solid and durable

With a sustainable, long life silicon coating of the drum, which is available as an option, maintenance will be kept to a minimum. Spare peeler drums and bottom discs are optionally available, so your peeling process can continue permanently.
